CD40102BMS
CD40103BMS

CMOS 8-Stage Presettable Synchronous Down Counters

December 1992

Features

- **High Voltage Type (20V Rating)**
- **CD40102BMS: 2-Decade BCD Type**
- **CD40103BMS: 8-Bit Binary Type**
- **Synchronous or Asynchronous Preset**
- **Medium Speed Operation**
  - **fCL = 3.6MHz (Typ) at 10V**
- **Cascadable**
- **100% Tested for Quiescent Current at 20V**
- **Maximum Input Current of 1μA at 18V Over Full Package Temperature Range; 100nA at 18V and +25°C**
- **Noise Margin (Over Full Package/Temperature Range)**
  - **1V at VDD = 5V**
  - **2V at VDD = 10V**
  - **2.5V at VDD = 15V**
- **Standardized Symmetrical Output Characteristics**
- **5V, 10V and 15V Parametric Ratings**
- **Meets All Requirements of JEDEC Tentative Standard No. 13B, "Standard Specifications for Description of 'B' Series CMOS Devices"**

Applications

- **Divide-By- "N" Counters**
- **Programmable Times**
- **Interrupt Timers**
- **Cycle/Program Counter**

Description

CD40102BMS and CD40103BMS consist of an 8-stage synchronous down counter with a single output which is active when the internal count is zero. The CD40102BMS is configured as two cascaded 4-bit BCD counters, and the CD40103BMS contains a single 8-bit binary counter. Each type has control inputs for enabling or disabling the clock, for clearing the counter to its maximum count, and for presetting the counter either synchronously or asynchronously. All control inputs and the CARRY-OUT/ZERO-DETECT output are active-low logic.

In normal operation, the counter is decremented by one count on each positive transition of the CLOCK. Counting is inhibited when the CARRY-IN/COUNTER ENABLE ($\overline{CI/CE}$) inputs is high. The CARRY-OUT/ZERO-DETECT ($\overline{CO/ZD}$) output goes low when the count reaches zero if the $\overline{CI/CE}$ input is low, and remains low for one full clock period.

When the SYNCHRONOUS PRESET-ENABLE ($\overline{SPE}$) input is low, data at the JAM input is clocked into the counter on the next positive clock transition regardless of the state of the $\overline{CI/CE}$ input. When the ASYNCHRONOUS PRESET-ENABLE ($\overline{APE}$) input is low, data at the JAM inputs is asynchronously forced into the counter regardless of the state of the $\overline{SPE}$, $\overline{CI/CE}$, or CLOCK inputs. JAM inputs J0-J7 represent two 4-bit BCD words for the CD40102BMS and a single 8-bit binary word for the CD40103BMS.

When the CLEAR ($\overline{CLR}$) input is low, the counter is asynchronously cleared to its maximum count (99_{10} for the CD40102BMS and 255_{10} for the CD40103BMS) regardless of the state of any other input. The precedence relationship between control inputs is indicated in the truth table.

If all control inputs except $\overline{CI/CE}$ are high at the time of zero count, the counters will jump to the maximum count, giving a counting sequence of 100 or 256 clock pulses long.

This causes the $\overline{CO/ZD}$ output to go low to enable the clock on each succeeding clock pulse.

The CD40102BMS and CD40103BMS may be cascaded using the $\overline{CI/CE}$ input and the $\overline{CO/ZD}$ output, in either a synchronous or ripple mode as shown in Figures 16 and 17.

The CD40102MS and CD40103BMS are supplied in these 16-lead outline packages:

Braze Seal DIP	*H4W	†H4X
Frit Seal DIP	*H1L	†H1F
Ceramic Flatpack	H6W	

*CD40102B Only †CD40130B Only

Absolute Maximum Ratings

DC Supply Voltage Range, (VDD) . . . . . -0.5V to +20V
(Voltage Referenced to VSS Terminals)
Input Voltage Range, All Inputs . . . . . -0.5V to VDD +0.5V
DC Input Current, Any One Input . . . . . ±10mA
Operating Temperature Range . . . . . -55°C to +125°C
Package Types D, F, K, H
Storage Temperature Range (TSTG) . . . . . -65°C to +150°C
Lead Temperature (During Soldering) . . . . . +265°C
At Distance 1/16 ± 1/32 Inch (1.59mm ± 0.79mm) from case for 10s Maximum

Reliability Information

Thermal Resistance	θ_{ja}	θ_{jc}
Ceramic DIP Package	80°C/W	20°C/W
Flatpack Package	70°C/W	20°C/W

Maximum Package Power Dissipation (PD) at +125°C
For T_A = -55°C to +100°C (Package Type D, F, K) 500mW
For T_A = +100°C to +125°C (Package Type D, F, K). . . . . Derate Linearity at 12mW/°C to 200mW
Device Dissipation per Output Transistor 100mW
For T_A = Full Package Temperature Range (All Package Types)
Junction Temperature . . . . . +175°C

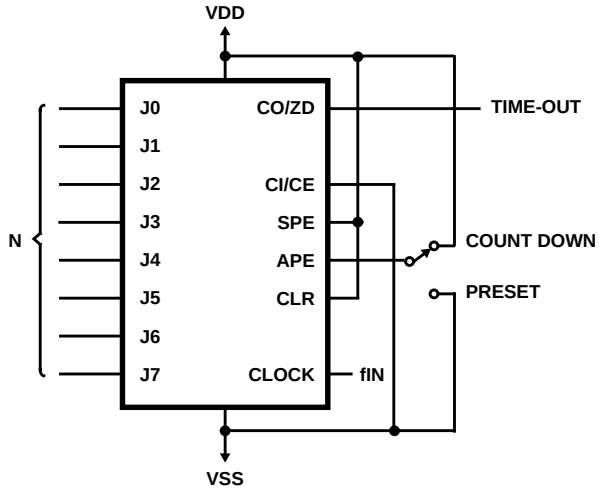

FIGURE 14. PROGRAMMABLE TIMER

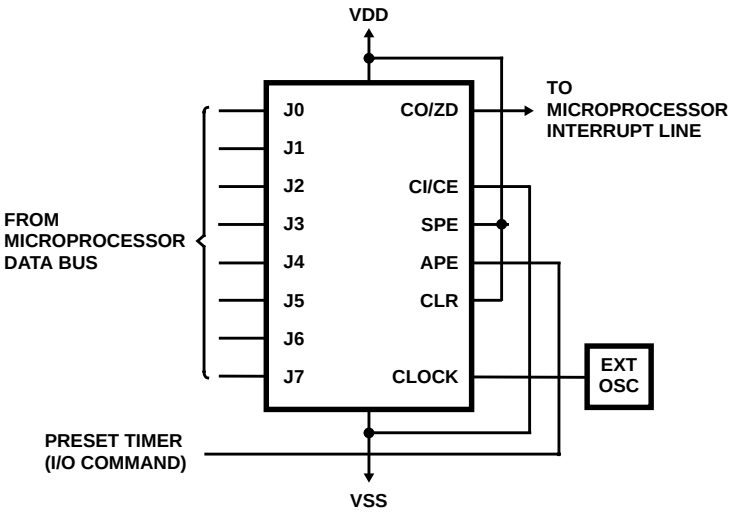

FIGURE 15. MICROPROCESSOR INTERRUPT TIMER

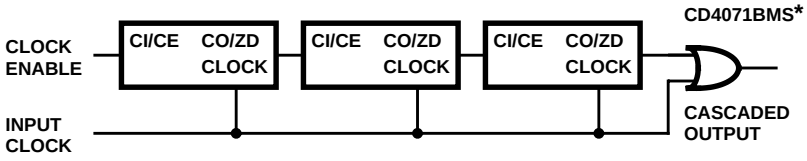

*An output spike (160ns at VDD = 5V) occurs whenever two or more devices are cascaded in the parallel-clocked mode because the clock-to-carry out delay is greater than the carry-in-to-carry out delay. This spike is eliminated by gating the output of the last device with the clock as shown.
